

## WEBINAR

# Towards Carbon-Neutral Buildings in the V4 region: Heating Decarbonisation and Life-cycle GWP of Buildings, Challenges and Best Practices

**12.06.2025**

**13:00-15:00**

**ONLINE**

**In the first part of the webinar, we will explore the decarbonisation of heating in both individual and district-level systems.** We will highlight policy approaches that have supported the shift away from coal and gas, focusing on successful examples from Central Europe. The role of heat pumps as a key low-carbon technology will be discussed, along with the importance of supportive electricity tariffs in accelerating their adoption. The session will also examine the transformation of district heating networks, including strategies to integrate low-temperature and renewable heat sources. Practical insights for scaling up clean heating through regulation and financial support will be shared.

**During the second part of the webinar we will present the policy context for the life-cycle GWP of buildings** with examples from leading European countries, as well as initiatives from V4 countries. We will also briefly present a proposed methodology for estimating the carbon footprint of buildings based on two approaches - the simplified and the full method and recommendations for actions that need to be taken to enable the life-cycle GWP calculations spread in the V4 countries.
